

## **ABSTRACT OF THE DISCLOSURE**

A rivet structure includes a main body having a first end formed with an enlarged head and a second end formed with an extended column. The main body is provided with four opposite fixing plates each having a tapered face and each having a bottom face. The bottom faces of the four fixing plates form a square shaped configuration. Thus, the rivet structure can be combined with an article rigidly and stably, thereby preventing the rivet structure from being rotated relative to the article.
